Constructing & Using a Key.

Keys are used to identify organisms based on a series of questions about their features. Dichotomous means 'branching into two' and it leads the user through to the name of the organism by giving two descriptions at a time and asking them to choose. Each choice leads the user onto another two descriptions. In order to successfully navigate a key, you need to pick a single organism to start with and follow the statements from the beginning until you find the name.

Dichotomous Key Definition. A dichotomous key is a tool created by scientists to help scientists and laypeople identify objects and organisms. Typically, a dichotomous key for identifying a particular type of object consists of a specific series of questions. When one question is answered, the key directs the user as to what question to ask next. Dichotomous keys typically stress identifying species by their scientific name, as each individual species has a unique scientific name.

In phylogenetics, a single-access key (also called dichotomous key, sequential key, analytical key, or pathway key) is an identification key where the sequence and structure of identification steps is fixed by the author of the key. At each point in the decision process, multiple alternatives are offered, each leading to a result or a further choice.

*Single-access key -
Wikipedia*

A dichotomous key is a tool that allows the user to determine the identity of items in the natural world, such as trees, wildflowers,
