This material is gathered in the present book Introduction to Econometrics with R, an empirical companion to Stock and Watson . It is an interactive script in the style of a reproducible research report and enables students not only to learn how results of case studies can be replicated with R but also strengthens their ability in using the newly acquired skills in other empirical applications.

A useful on-line and free resource is “ Econometrics in R ” by Grant Farnsworth. It covers some common econometric methods including heteroskedasticity in regression, probit and logit models, tobit regression, and quantile regression. In the time series area, it covers ARIMA, ARFIMA, ARCH and GARCH models, as well as a few of the standard tests for unit roots and autocorrelation.

This tutorial was prepared for the Ninth Annual Midwest Graduate Student Summit on Applied Economics, Regional, and Urban Studies (AERUS) on April 23rd-24th, 2016 at the University of Illinois at Urbana Champaign. This notes illustrate the usage of R for spatial econometric analysis. The theory is heavily borrowed from Anselin and Bera (1998) and Arbia (2014) and the practical aspect is an updated version of Anselin (2003), with some additions in visualizing spatial data on R.
