In October 2013, the International Safeguards Group at Oak Ridge National Laboratory (ORNL) installed and commissioned a Platform Scale Testing Center designed to investigate the accuracy and performance capabilities of a variety of load cell weighing systems. Installed at the National Transportation Research Center, this test facility currently consists of two platform scales that mimic the size, capacity, and function of weighing systems used in a uranium hexafluoride product withdrawal station. The facility provides ORNL with the ability to investigate various operational scenarios. It also provides a means to simulate full weight profiles not previously obtainable from the existing small-scale mock feed and withdrawal system. Each scale consists of a top weigh frame that is mounted to load cells in each corner. The load cells are connected to a weighing indicator that contains one or more analog-to-digital converters and reports the weight value in engineering units. For industrial scales of this type, the National Institute of Standards and Technology (NIST) Handbook 44 standard error specification is 0.2% (of the load on the scale) or better. Two different commissioning tests were conducted on each scale, an increasing and decreasing test and a shift test. These tests were conducted as described by the NIST Handbook 44 weighing system standard. These tests allowed ORNL staff to (1) ensure that the scales were functioning properly, (2) determine each scale's general accuracy, (3) evaluate the scale's hysteresis and nonlinearity, and (4) address concerns that uneven load distribution could cause erroneous readings. The first scale was designed and manufactured by Eagle Microsystems. It has a size of 5' × 9 ft and has a capacity of 17,637 lb (8,000 kg). This scale is fitted with one shear-beam load cell in each corner. The scale was calibrated and tested first with an EI-4000 weighing indicator, custom designed by Eagle Microsystems to display weight on each load cell independently as well as a total weight. Afterwards, this scale was recalibrated and tested with an off-the-shelf Mettler Toledo junction box and Ohaus CD-33 weighing indicator. A second scale was designed and manufactured by Carton Scale. It is 5' × 10 ft and has a capacity of 10,000 lb (4,536 kg). This scale is fitted with a weigh module in each corner. Each weigh module has two load cells stacked on top of one another allowing the Carlton scale to connect to two different weighing indicators at the same time, providing separate, simultaneous weight readings. One set of load cells was calibrated and tested with a Mettler Toledo junction box and IND-560 weighing indicator. The second set of load cells was calibrated and tested with each load cell wired to a separate analog card in a Mettler Toledo IND-780 weighing indicator, which displayed the weight from each load cell independently as well as a total weight. The most important findings of the commissioning tests were that the scales performed best when calibrated using a standard span calibration method and in general were robust against uneven load distribution and did not demonstrate significant hysteresis or nonlinearity.

When calibrated using the standard span calibration method, the Eagle Microsystems scale demonstrated an average total error of 0.025% and the Carlton scale 0.015%, both well within NIST standards of 0.2%. The errors caused by uneven load distribution were only slightly higher than the error with an even load distribution. An additional test was conducted to address a question regarding the scales response when a single load cell was disconnected from the weighing indicator while the weight reading was taken. With a load cell disconnected, an average error of 0.59% was demonstrated when the weight was evenly distributed on the scale. When the weight was unevenly distributed, an average error of 5.1% was demonstrated. Most importantly, this test showed that anomalies in the weight da ...

In recent years, with the introduction of new media products, there has been a shift in the use of programming languages from FORTRAN or C to MATLAB for implementing numerical methods. This book makes use of the powerful MATLAB software to avoid complex derivations, and to teach the fundamental concepts using the software to solve practical problems. Over the years, many textbooks have been written on the subject of numerical methods. Based on their course experience, the authors use a more practical approach and link every method to real engineering and/or science problems. The main benefit is that engineers don't have to know the mathematical theory in order to apply the numerical methods for solving their real-life problems. An Instructor's Manual presenting detailed solutions to all the problems in the book is available online.
