With clear, critical, and constructive surveys of key terms by leading researchers in the field, *The Dictionary of Human Geography*, fifth edition, remains the definitive guide to the concepts and debates in human geography. Comprehensively revised new edition of a highly successful text with over 300 key terms appearing for

This timely Research Agenda highlights how slow violence, unlike other forms of conflict and direct, physical violence, is difficult to see and measure. It explores ways in which geographers study, analyze and draw attention to forms of harm and violence that have often not been at the forefront of public awareness,

The Routledge Companion to Media and Tourism provides a comprehensive overview of the research into the convergence of media and tourism and specifically investigates the concept of mediatized tourism. This Companion offers a holistic look at the relationship between media and tourism by drawing from a global range of contributions by scholars from disciplines across the humanities and social sciences. The book is divided into five parts, covering diverse aspects of mediatization of tourism including place and space, representation, cultural production, and transmedia. It features a

Comprehensive theoretical introduction and an afterword by leading scholars in this emerging field, delving into the ways in which different forms of media content and consumption converge, and the consequential effects on tourism and tourists. The collection is an invaluable resource for students and scholars of tourism studies, cultural studies, and media and communication, as well as those with a particular interest in mediatization, convergence culture, and contemporary culture.

While many Americans dismissed the borough of The Bronx in the late 1970s through the belief that »The Bronx is burning,« this study challenges that assumption. As the first explicit study on The Bronx in American popular culture, this book

Shows how a wide variety of cultural representations engaged in a complex dialogue on its past, present, and future. Sina A. Nitzsche argues that popular culture ushered in the poetic resurrection of The Bronx, an artistic and imaginative rebirth, that preceded, promoted, and facilitated the spatial revival of the borough.

Since the late 1980s, critical geopolitics has gone from being a radical critical perspective on the disciplines of political geography and international relations theory to becoming a recognised area of research in its own right. Influenced by poststructuralist concerns with the politics of representation, critical geopolitics considers the ways in which the use of particular discourses shape political practices. Initially

Critical geopolitics analysed the practical geopolitical language of the elites and intellectuals of statecraft. Subsequent iterations have considered the role that popular representations of the international political world play. As critical geopolitics has become a more established part of political geography it has attracted ever more critique: from feminists for its apparent blindness to the embodied effects of geopolitical praxis and from those who have been uncomfortable about its textual focus, while others have challenged critical geopolitics to address alternative, resistant forms of geopolitical practice. Again, critical geopolitics has been reworked to incorporate these challenges and the latest iterations have encompassed normative agendas, non-

Representational theory, emotional geographies and affect. It is against the vibrant backdrop of this intellectual development of critical geopolitics as a subdiscipline that this Companion is set. Bringing together leading researchers associated with the different forms of critical geopolitics, this volume produces an overview of its achievements, limitations, and areas of new and potential future development. The Companion is designed to serve as a key resource for an interdisciplinary group of scholars and practitioners interested in the spatiality of politics.

This book is about the relation between scientific research and professional practice on the built environment. The physical form of cities is structured in different

Elements of urban form. Each of these elements, and the way they are combined into distinct patterns, is shaped by various agents and processes of change. Planning, urban design and architecture are practice-oriented activities that have a significant impact on these elements. Yet, this 'action' on the physical form of cities tends to be separated from scientific 'knowledge' on this complex object. In fact, none of these activities is strongly related to urban morphology, the science of urban form. There are many reasons for this gap. One of the reasons is the lack of significant examples of how the bridging process can happen. The book addresses this specific issue. It gathers a number of cases, developed in the last years in different geographical contexts – from Latin

America to Eastern Asia – that exemplify how to move from scientific research to professional practice. Each case, or set of cases, is presented in one chapter. The first part of each chapter presents the morphological view of his/her author(s) on the process of city building; the second part exemplifies how this author moves from reading to design.

Ports in Proximity provides an overview of key contemporary research in the field through a broad range of international case studies. The concepts of strategic management, supply chain management, port and transport economics and economic and transport geography are applied

Throughout the book to offer an in-depth understanding of the processes underlying spatial and functional dynamics in port systems. The opportunities for cooperation between competing adjacent ports is examined while the avenues for further joint research are identified, setting an agenda for further study.

Trees are among the longest-living organisms. They are sensitive to extreme climatic events and document the effects of environmental changes in form of structural modifications of their tissues. These modifications represent an integrated signal of complex biological responses enforced by the environment. For example, temporal change in stem increment integrates multiple information of tree performance, and wood anatomical

traits may be altered by climatic extremes or environmental stress. Recent developments in preparative tools and computational image analysis enable to quantify changes in wood anatomical features, like vessel density or vessel size. Thus, impacts on their functioning can be related to climatic forcing factors. Similarly, new developments in monitoring (cambial) phenology and mechanistic modelling are enlightening the interrelationships between environmental factors, wood formation and tree performance and mortality. Quantitative wood anatomy is a reliable indicator of drought occurrence during the growing season, and therefore has been studied intensively in recent years. The variability in wood anatomy not only alters the biological and hydraulic functioning of a tree, but may also

Influence the technological properties of wood, with substantial impacts in forestry. On a larger scale, alterations of sapwood and phloem area and their ratios to other functional traits provide measures to detect changes in a tree's life functions, and increasing risk of drought-induced mortality with possible impacts on hydrological processes and species composition of plant communities. Genetic variability within and across populations is assumed to be crucial for species survival in an unpredictable future world. The magnitude of genetic variation and heritability of adaptive traits might define the ability to adapt to climate change. Is there a relation between genetic variability and resilience to climate change? Is it possible to link genetic expression and climate change to obtain deeper

Acces PDF Mind The Gap Geography Study Guide

Knowledge of functional genetics? To derive precise estimates of genetic determinism it is important to define adaptive traits in wood properties and on a whole-tree scale. Understanding the mechanisms ruling these processes is fundamental to assess the impact of extreme climate events on forest ecosystems, and to provide realistic scenarios of tree responses to changing climates. Wood is also a major carbon sink with a long-term residence, impacting the global carbon cycle. How well do we understand the link between wood growth dynamics, wood carbon allocation and the global carbon cycle? Papers contribution to this Research Topic will cover a wide range of ecosystems. However, special relevance will be given to Mediterranean-type areas. These involve coastal regions of four

Continents, making Mediterranean-type ecosystems extremely interesting for investigating the potential impacts of global change on growth and for studying responses of woody plants under extreme environmental conditions. For example, the ongoing trend towards warmer temperatures and reduced precipitation can increase the susceptibility to fire and pests. The EU-funded COST Action STREeSS (Studying Tree Responses to extreme Events: a SynthesiS) addresses such crucial tree biological and forest ecological issues by providing a collection of important methodological and scientific insights, about the current state of knowledge, and by opinions for future research needs.
